

# DO YOU KNOW?

## Opioid Use Disorder (OUD)

In Florida, drug-related deaths are the **leading cause of death** (1 in 4) for women during pregnancy and through one year postpartum.

Every pregnant patient should be **screened prenatally and on delivery admission with a validated substance use disorder (SUD)/OUD screening tool.**

A **Plan of Safe Care** should be developed in collaboration with multiple community partners.

Key risk reduction strategies for pregnant and postpartum patients with OUD (**Start Medication-Assisted Treatment [MAT], link to a recovery program, and provide Naloxone [Narcan]**).

**Close follow-up, warm hand-offs, and reducing stigma** across clinical teams improves care and outcomes.

# "You can save a mother's life."
